

CLASSES AND OBJECTS

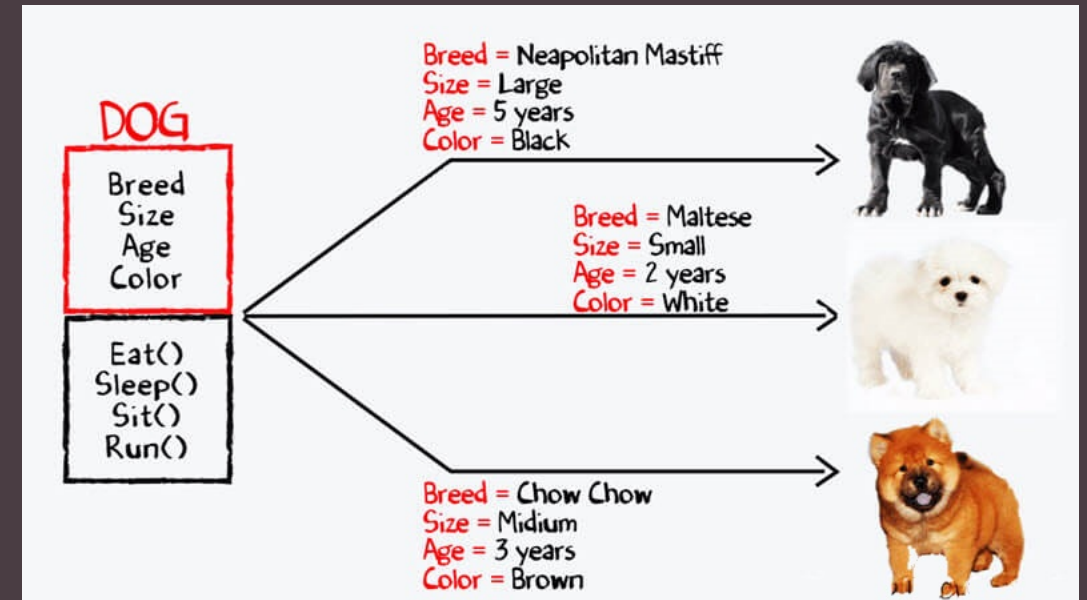

Classes : Where Objects Come From

- A class is an entity that determines how an object will behave and what the object will contain.
- A class is a **blueprint** or set of instruction to build a specific type of object.

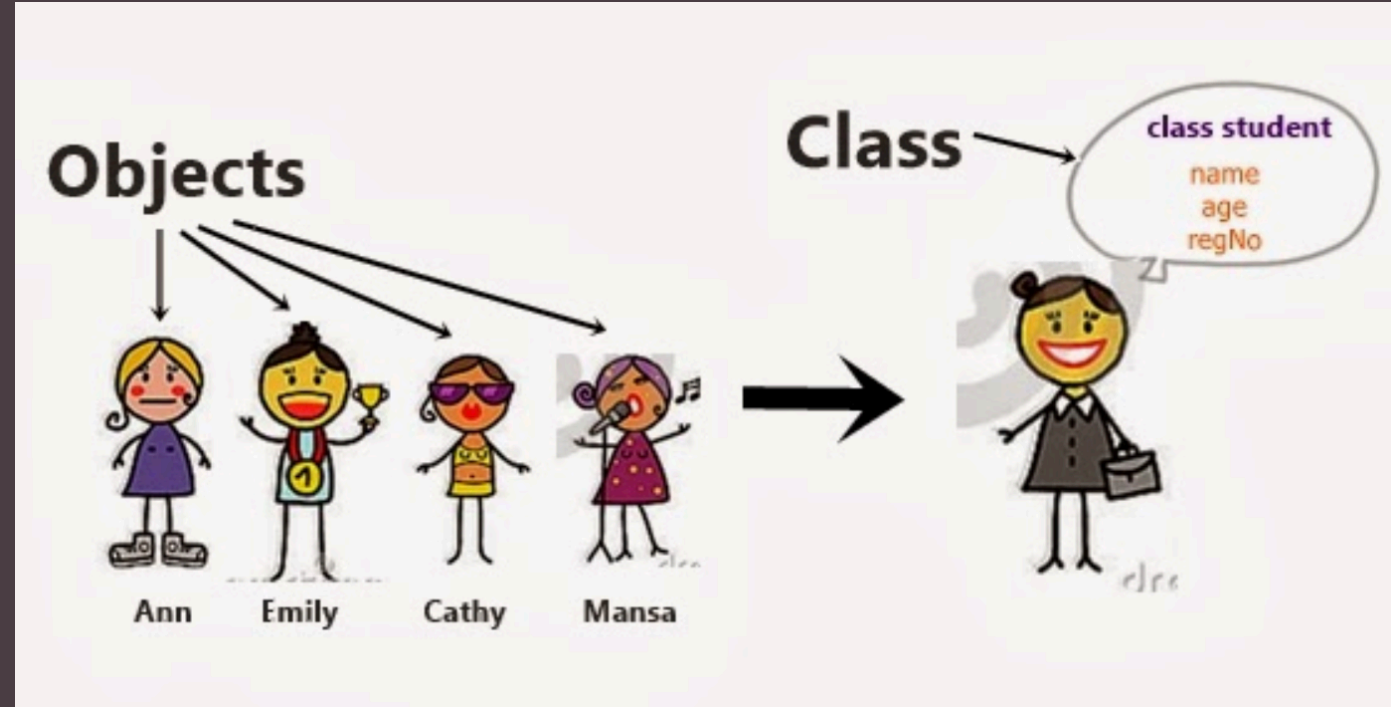

Objects

- An object is an instance of a class.
- An object can store data. The data stored in an object are commonly called **fields**.

Class and Object Examples

Writing a Simple Class

Class Name
Fields
Methods

Dog
breed size age color
getInfo()

Access Modifier keyword Class Name

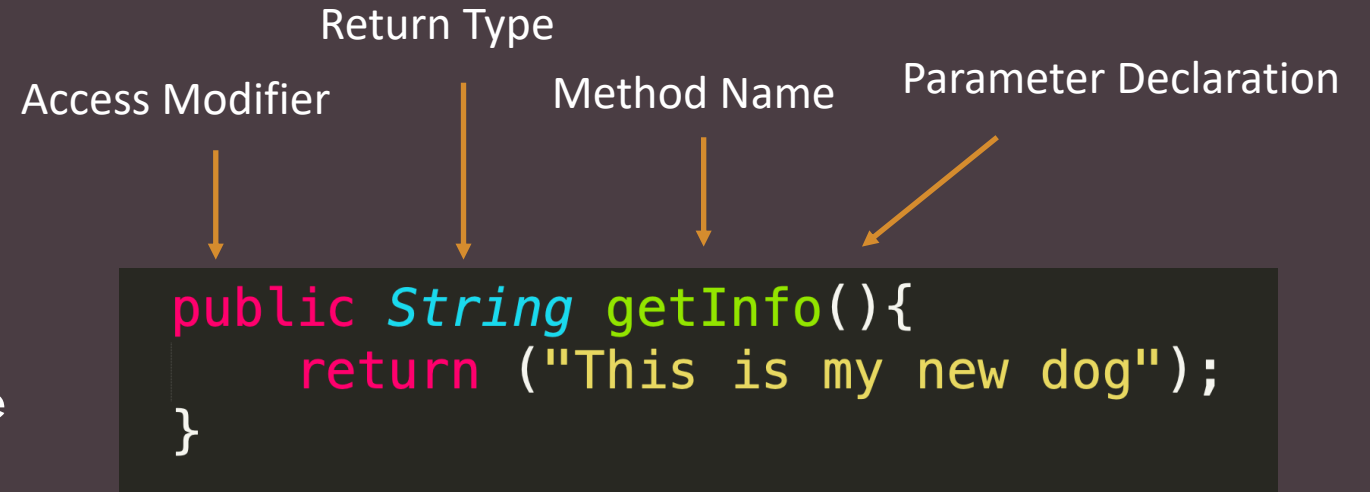

```
public class Dog{  
  
    String breed;  
    String size;  
    int age;  
    String color;  
  
    public String getInfo(){  
        return ("This is my new dog");  
    }  
  
}
```

Access Modifier

- An access modifier indicates how the class may be accessed.
- The **public** access modifier indicates that the class will be publicly available to code that is written outside of the class.

Writing a Method

- Notice that the word **static** does not appear in the method header.
- When a method is designed to work on an instance of a class, it is referred to as an **instance method**, and you do not write the word **static** in the header.

Creating an Object/Instance

- The **new** keyword is used to create an instance of a class.

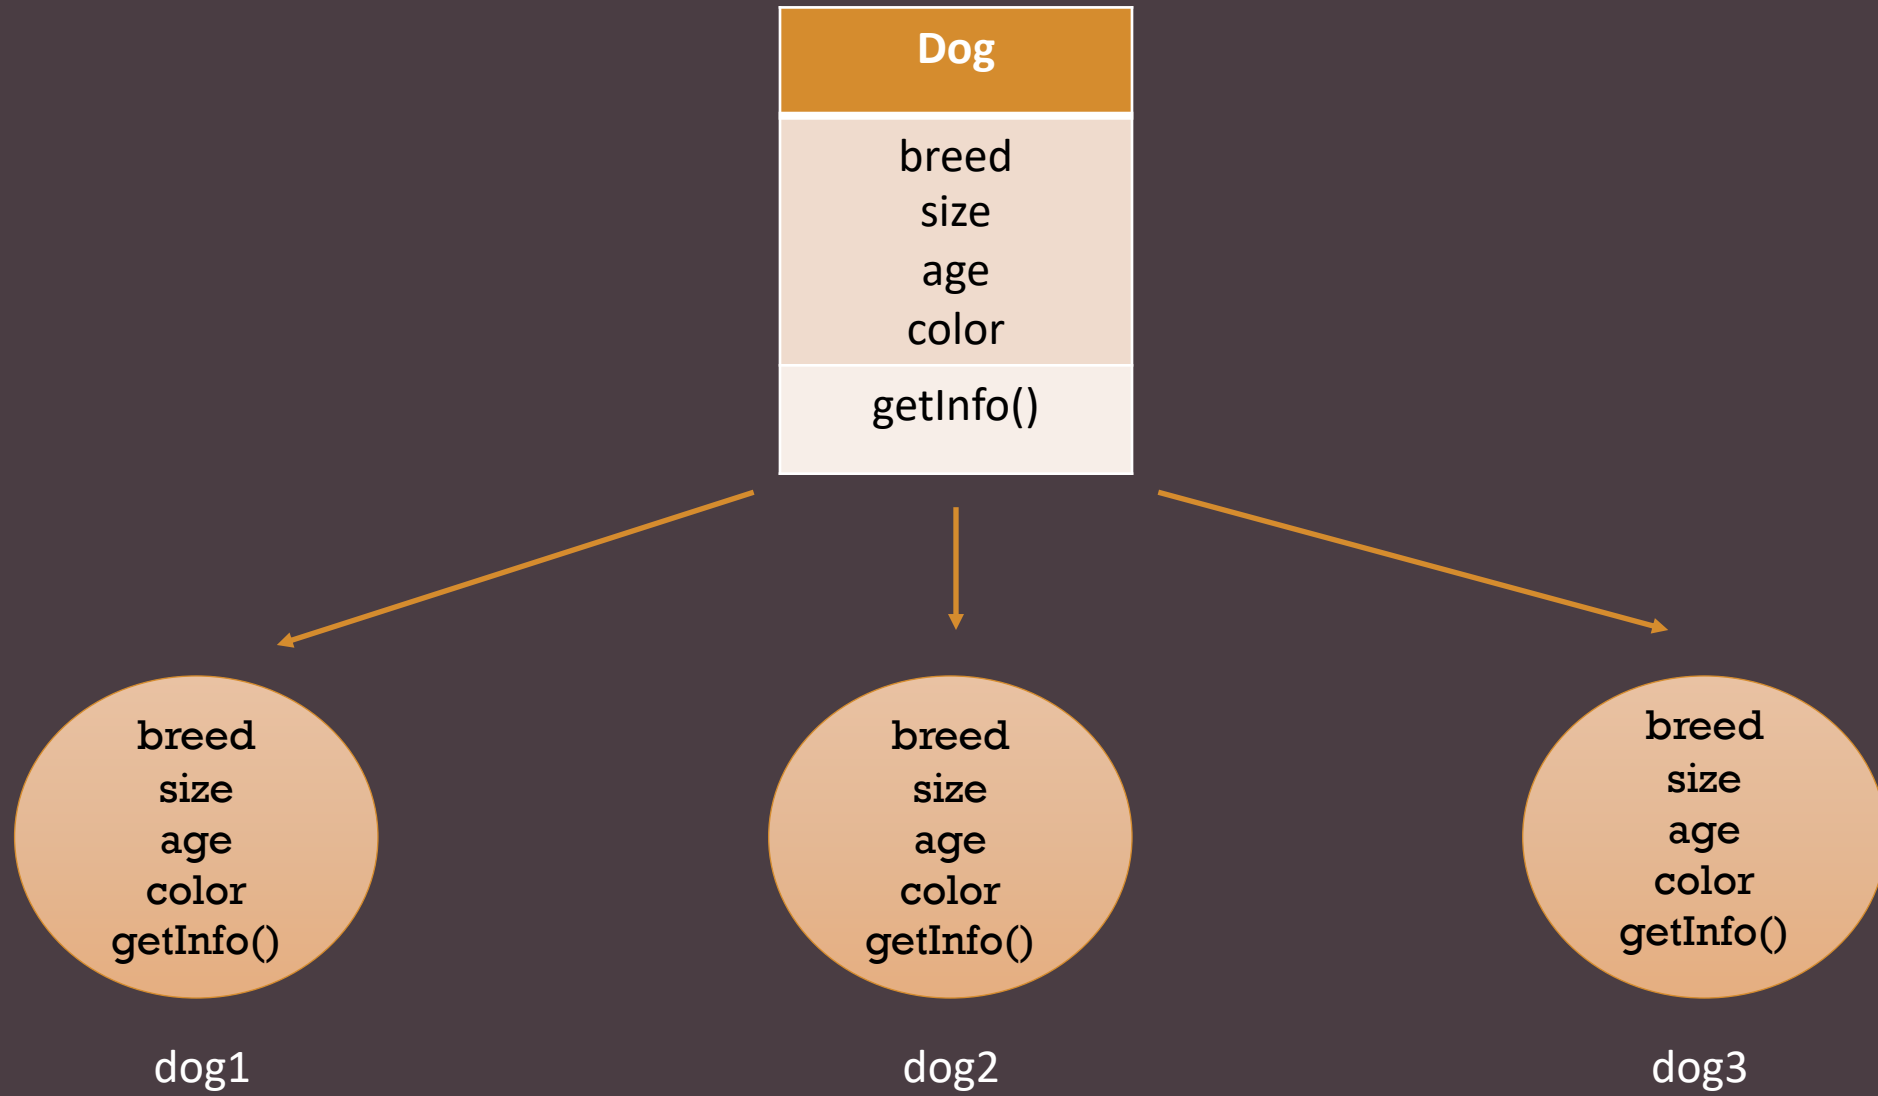

```
Dog dog1 = new Dog();
```

Class Name

Object Name

Keyword

Constructor

Default values for Instance Variables

```
public class Student{  
    String name; //name has the default value null  
    int age; //age has the default value 0  
    boolean isScienceMajor; //isScienceMajor has default value false  
    char gender; //gender has default value '\u0000'  
}
```

Accessing an Object's Data and Methods?

- An Object's member refer to its data fields and methods. After an object is created, its data can be accessed and its methods can be invoked using the **dot operator (.)**

```
dog1.breed = "Maltese";  
dog1.size = "Small";  
dog1.age = 2;  
dog1.color = "white";  
dog1.getInfo();
```

Class vs Object

Class	Object
Class is a collection of similar objects	Object is an instance of a class
Class is conceptual (is a template)	Object is real
No memory is allocated for a class	Each object has its own memory
Class can exist without any objects	Objects can not exist without a class
